

## Gastight Rectangular Shut-Off Damper, Type S

## Shut-off dampers with high tightness requirements

Krantz has developed the gastight, rectangular shut-off damper, type S, for use in ventilating systems with high requirements in regard to tightness, e.g. in nuclear facilities, laboratories, etc.

The requirements on tightness as laid down in the German standard DIN 25496 – Ventilating components in nuclear facilities- are more than satisfied.

Several decades of experience gathered in the operation of shut-off damper systems in nuclear facilities and labs have decisively influenced the design and shape.

Quite a number of references from various locations of shut-off damper installation have proved the high level of perfection attained by this component.

## Structural design and function

The shut-off damper consists of a damper housing, a hinged damper blade with the damper shaft as its bearings, and an actuating cylinder moving the damper blade by an actuating equipment.

A sealing profile made of silicone rubber is fastened to the damper blade by a leading bar. Upon closure of the damper, this sealing profile is pressed against the damper housing by means of an inflatable silicon tube which produces the sealing effect.

The sealing profile provided with two double lips allows the tight seat of the damper blade on the mounted shut-off damper to be checked.

The damper blade and the damper housing are made of stainless steel, the tube leading bars and profiles consists of aluminium.

The control unit is placed on the head of the actuating cylinder. The shut-off damper is actuated from a customer provided switch-board cabinet.

The media supplies needed by the control unit are electric energy as well as compressed air, 3 bar overpressure, oil free and waterless.

The shut-off damper is actuated by means of a double acting pneumatic cylinder. The control unit ensures the proper sequence of motions including tube inflation and venting, resp.

Special versions or special equipment on request.

Gastight rectangular shut-off damper, type S

### Quality and safety concept

- Tightness of housing and seat better than required by DIN 25496, table 3, for "gastight" dampers, leakage rate  $< 10 \text{ dm}^3 / (\text{m}^2 \cdot \text{h})$
- Tightness achieved by a special sealing profile and inflatable sealing tube
- External test of damper seat tightness possible by application of a portable leak test device, type LTD
- Component is capable for disinfection
- Gapeless and continuous welds; welding approvals and welders qualification in conformity with German codes and standards
- Calculated proofs for accommodation of the "external event"

Gastight rectangular shut-off damper, type S

## Actuation

### Function

#### Closing

Electric signal switches solenoid valve **1** as shown in diagram. The following lines are under pressure:

- **2** line 1 and 2
- **3** line 2
- **4** line 1 and 2

that leads to the following operation:

**2** switches so pressure can flow through line 3, passing **5** (fully opened) and press the cylinder **7** to close the damper blade. The air flowing off the cylinder passes **6** (throttled)

and via **3** line 3-1 and **1** line 4-5 to the open air. To throttle **6** causes a smooth movement of the actuating cylinder.

According to the adjusted time, **4** opens with delay to make sure the damper blade is closed. The air passes **8** (connection to open air closed when under pressure). The tube is inflated and the damper sealed gastight. The pressure has to be hold to keep the tube inflated.

#### Opening

Electric signal switches solenoid valve **1**.

Pressure breaks down at:

- **2** line 1
- **4** line 1

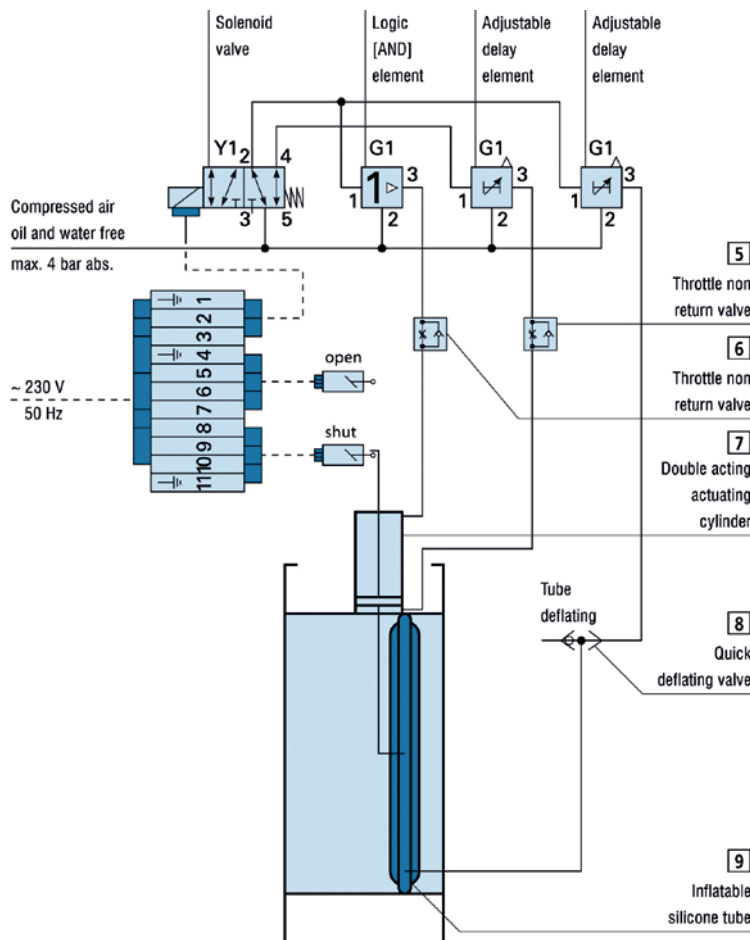

The following lines are under pressure::

- **2** line 2
- **3** line 1 and 2
- **4** line 2

that leads to the following operation:

By connection to open air in **1** line 2-3, pressure breaks down through **4** to **8**. **8** opens to the open air and the tube is quickly deflated

According to the adjusted time, **3** opens with delay to make sure the tube is deflated. The air passes **6** (fully opened) and presses the cylinder **7** to open the damper blade. The air flowing off the cylinder passes **5** (throttled) and via **2** line 3-1 and **1** line 2-3 to the open air. To throttle **5** causes a smooth movement of the actuating cylinder.

**Normal** = Compressed air consumption at standard conditions (1.013 bar / 20 °C) for each closing in dm<sup>3</sup>

**Example for calculation**

B / H = 630 / 400  
 Compressed air consumption at standard conditions = 7.3 dm<sup>3</sup><sub>STP</sub>  
 Compressed air consumption at an overpressure of 3 bar = 7.3 dm<sup>3</sup> / 4 = 1.8 dm<sup>3</sup>

### Text for tender

in solid, maintenance free design

- Housing, damper seat and actuator insertion gastight. Allowable leakage rate  $10\text{l/h} \cdot \text{m}^2$  at a pressure difference of 20mbar acc. DIN 25496 Tab. 3
- Damper blade with sealing profile from silicone rubber. Tightness of the damper seat by means of inflating of a silicon tube which presses the sealing profile against the damper housing
- Sealing profile designed with double lips for testing the damper seat tightness from outside by means of a tight seat testing equipment
- Housing with connection frames on both sides
- Housing, damper blade, damper shaft and actuator rods made from stainless steel 1.4541
- Double-acting pneumatic cylinder for damper blade operation
- Two limit switches for signalization of damper position "open" and "close"
- Control unit for opening resp. closing the damper as well as for inflating resp. venting the silicon tube. The control unit is placed on the head of the pneumatic cylinder.

### Technical data

Fabricate:	Krantz
Type:	S
Admissible operating pressure for housing:	$\pm 10\,000\text{ Pa}$
Admissible differential pressure for damper blade in both directions :	$\pm 10\,000\text{ Pa}$
Design temperature:	$-20\text{ °C up to }+120\text{ °C}$
Admissible leakage rate (related to housing surface resp. damper cross section):	$10\frac{\text{dm}^3}{\text{m}^2\text{ h}}$ at $\Delta p = 2\,000\text{ Pa}$
Medium supply:	
Compressed air, oil free and waterless	positive pressure 3 bar
Current:	230 V, 50 Hz
Position indication "open" and "close":	
– Mechanical:	Position indicator
– Electrical:	2 limit switches
Actuator:	Pneumatic
Regulation time:	30 s, longer times adjustable
Material:	
– Housing	1.4541 (AISI/SAE 321 or B.S. 321 S12)
– Damper blade	1.4541 (AISI/SAE 321 or B.S. 321 S12)
– Damper sealing	Silicone

## Testing tightness of damper blade

### Accessory

- Portable leak test device, type LTD
- Tube for measurement with nipple for fast acting coupling
- Hand pump

### Procedure

#### 1. Step

Closing the damper blade by actuating the switchboard cabinet.

- ▶ Distinguishable at the position indicator of the pneumatic actuator

#### 2. Step

Connect the leak test device by means of the fast acting coupling. (See separate manual for leak test device, type LTD.)

Gastight rectangular shut-off damper, type S

Leak test device, type LTD
